

Development of the Optical Detector Module For IceCube-Gen2

The second annual conference of
Transformative Research Areas (A),
“Multimessenger Astrophysics”

20/11/2024 (Wed)

Tomoyuki Tsuji / Yujiro Kasai

IceCube-Upgrade

- Target : low energy Neutrinos (\sim GeV)
- Deployment begins in 2025

IceCube-Gen2

- Target : **High Energy Neutrinos** ($>$ TeV)
- 8 km³ Volume (**8 times Gen1**)
- New **10000 Detector** will be deployed

Improvement

- Higher sensitivity
 - Angular resolution
 - Higher statistics

Why do we need new detectors?

In Gen2, the horizontal spacing between detectors will be increased.

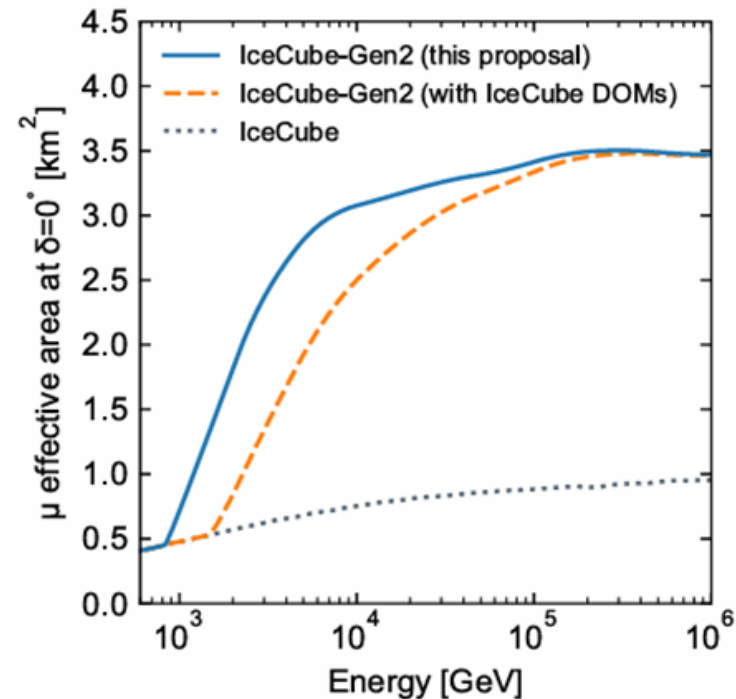

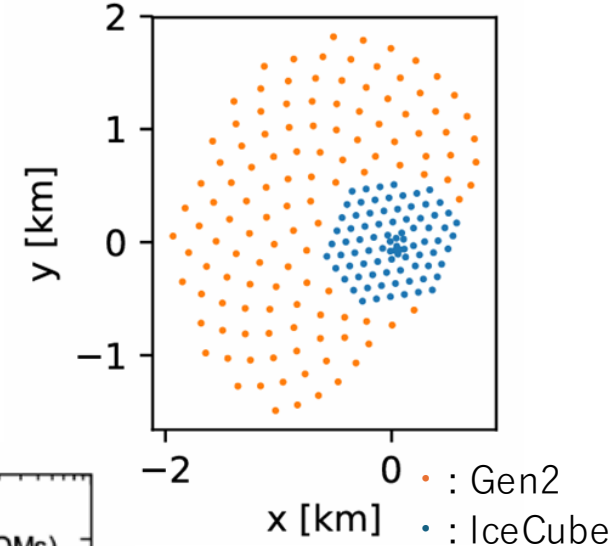

- Gen1 : 125m
 - Gen2 : 250m
- ➔ **Twice as large as Gen1**

Problem

If we continue to use Gen1-DOMs for Gen2,
Sensitivity in the TeV region degrades

A more sensitive detector is needed.

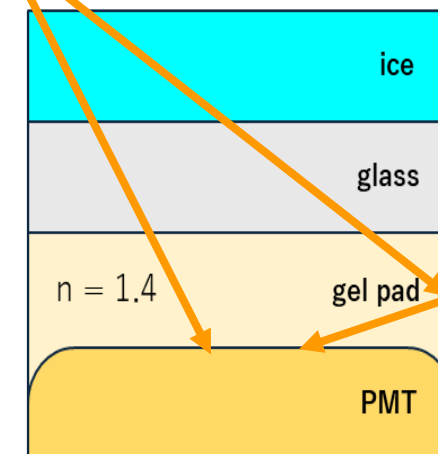

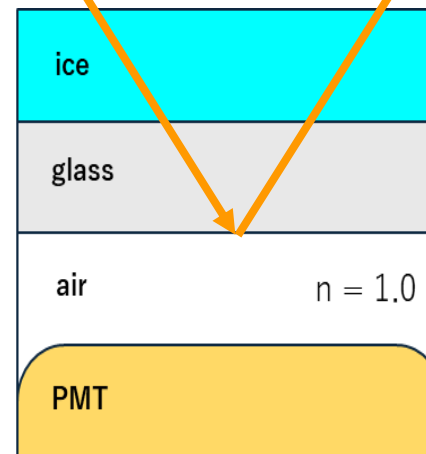

Gen2-prototype

Gen2-prototype

Concept : More sensitive detector for Gen2

- Feature ①** : 18 × 4inch PMTs
→ Expand light collecting area
- Feature ②** : Gel Pad
→ improve sensitivity

Improvement of dynamic range

Need to measure 1 ~ 10000 photo electrons

Gen1

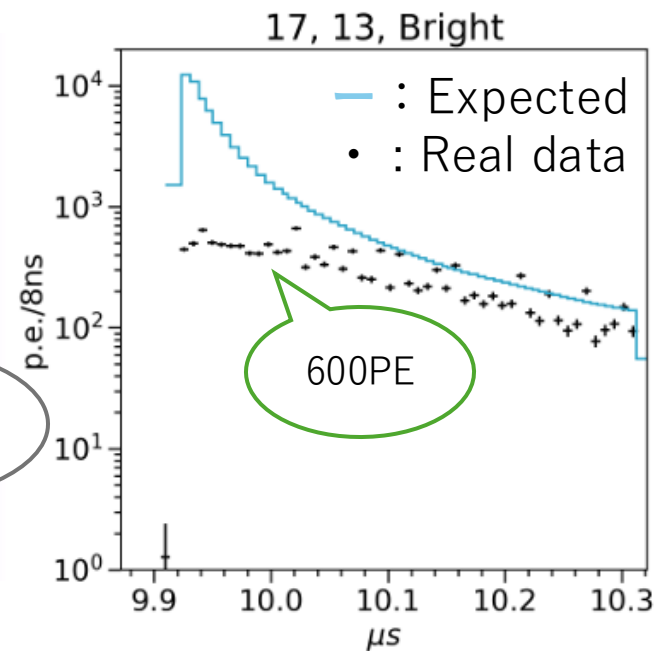

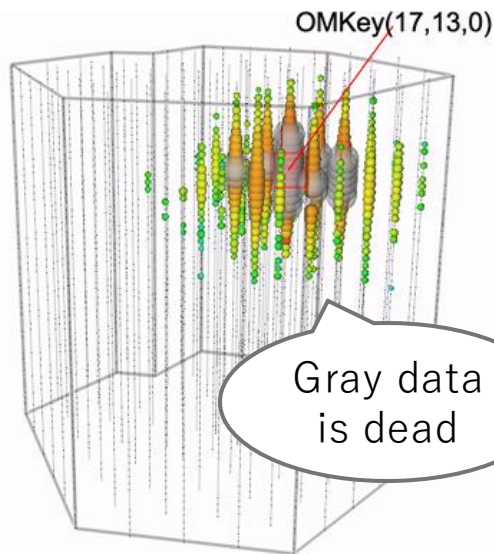

- Too **bright** light saturates PMTs

Dynamic range must be **Improved** !

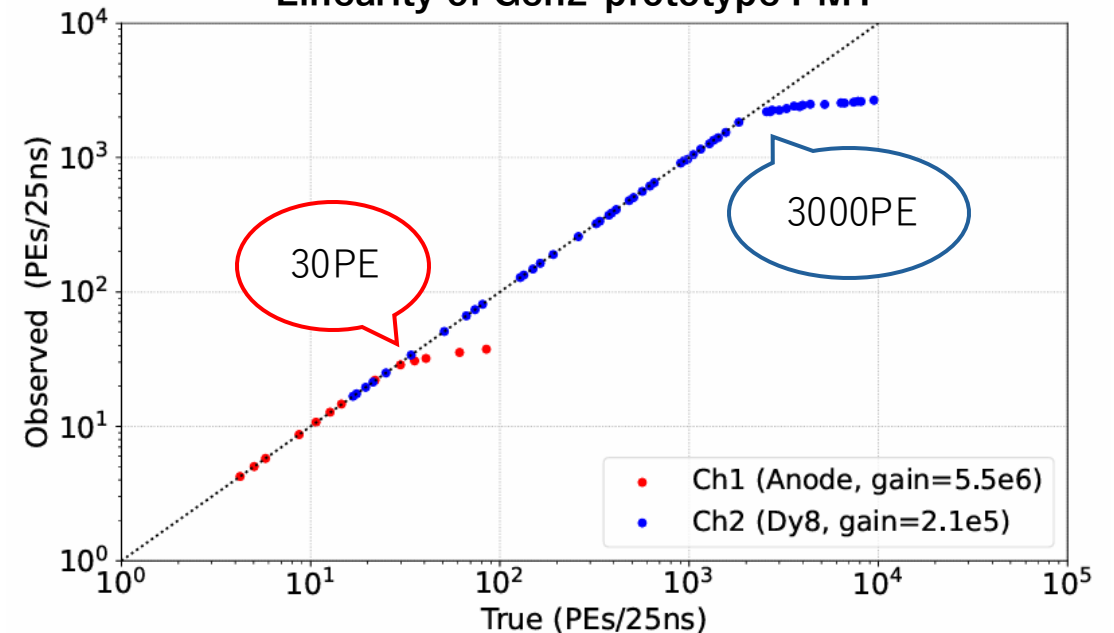

Solution : **Ch1** (low gain) & **Ch2** (high gain)

Gen 1

Gen 2

Linearity of Gen2-prototype PMT

IceCube-Upgrade as Gen2-Phase1

Main detector

D-Egg

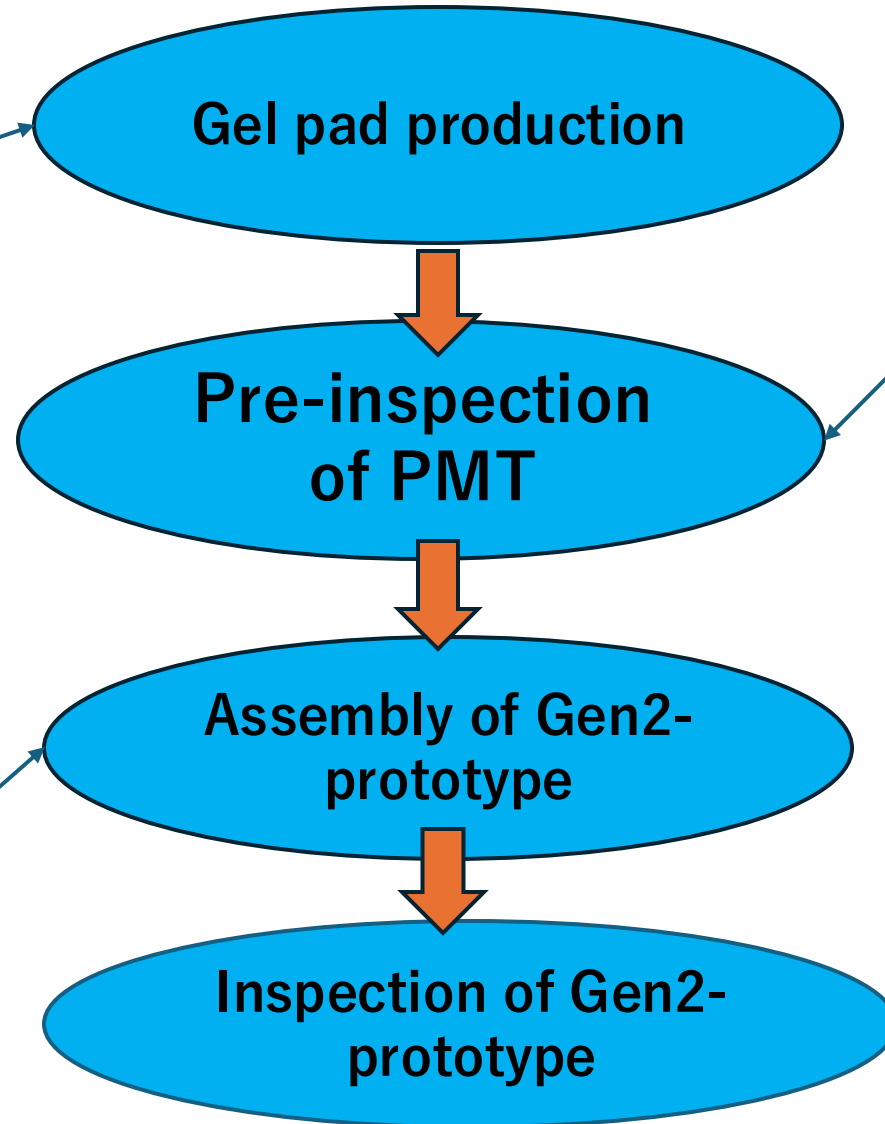

mDOM

12 Gen2-prototypes will be deployed to check their performances

Gen2-prototype Production Flow

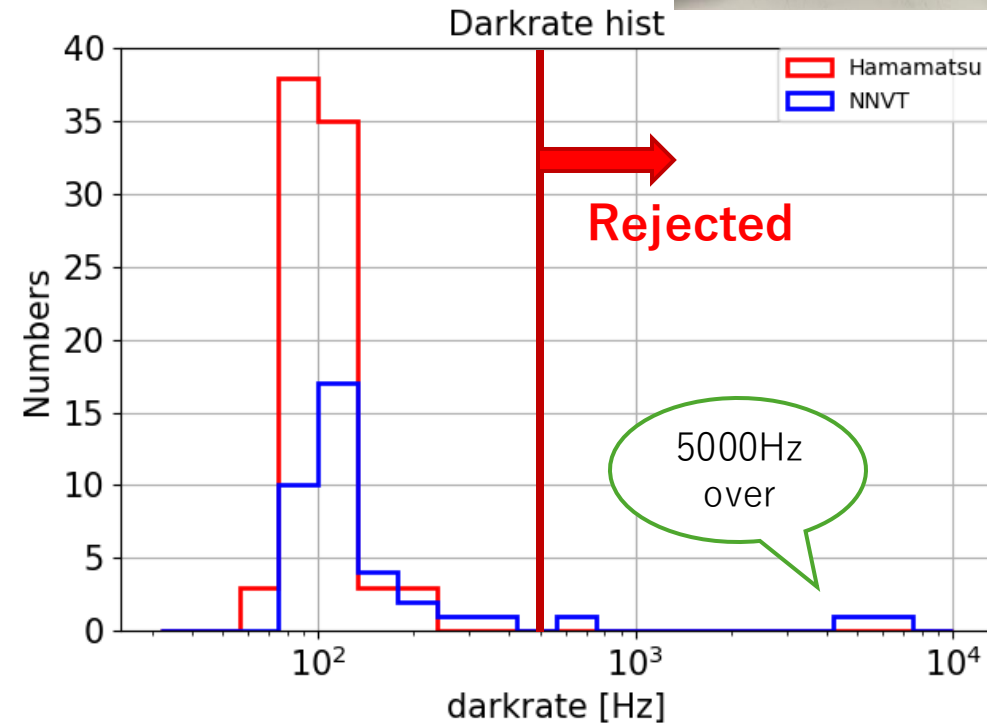

Pre-inspection Test

NNVT

Hamamatsu

Purpose

Assurance of the PMTs before their installation

Pre-inspection Test can prevent the introduction of PMTs with bad performance

Assembly of Gen2-prototype

Gel pad production

Gen2-prototype assembly

① Produce gel pads in three different shapes using a specific jig

② Assemble hemispheres using gel pad PMT
③ Upper and lower hemispheres are combined to complete the Gen2-prototype

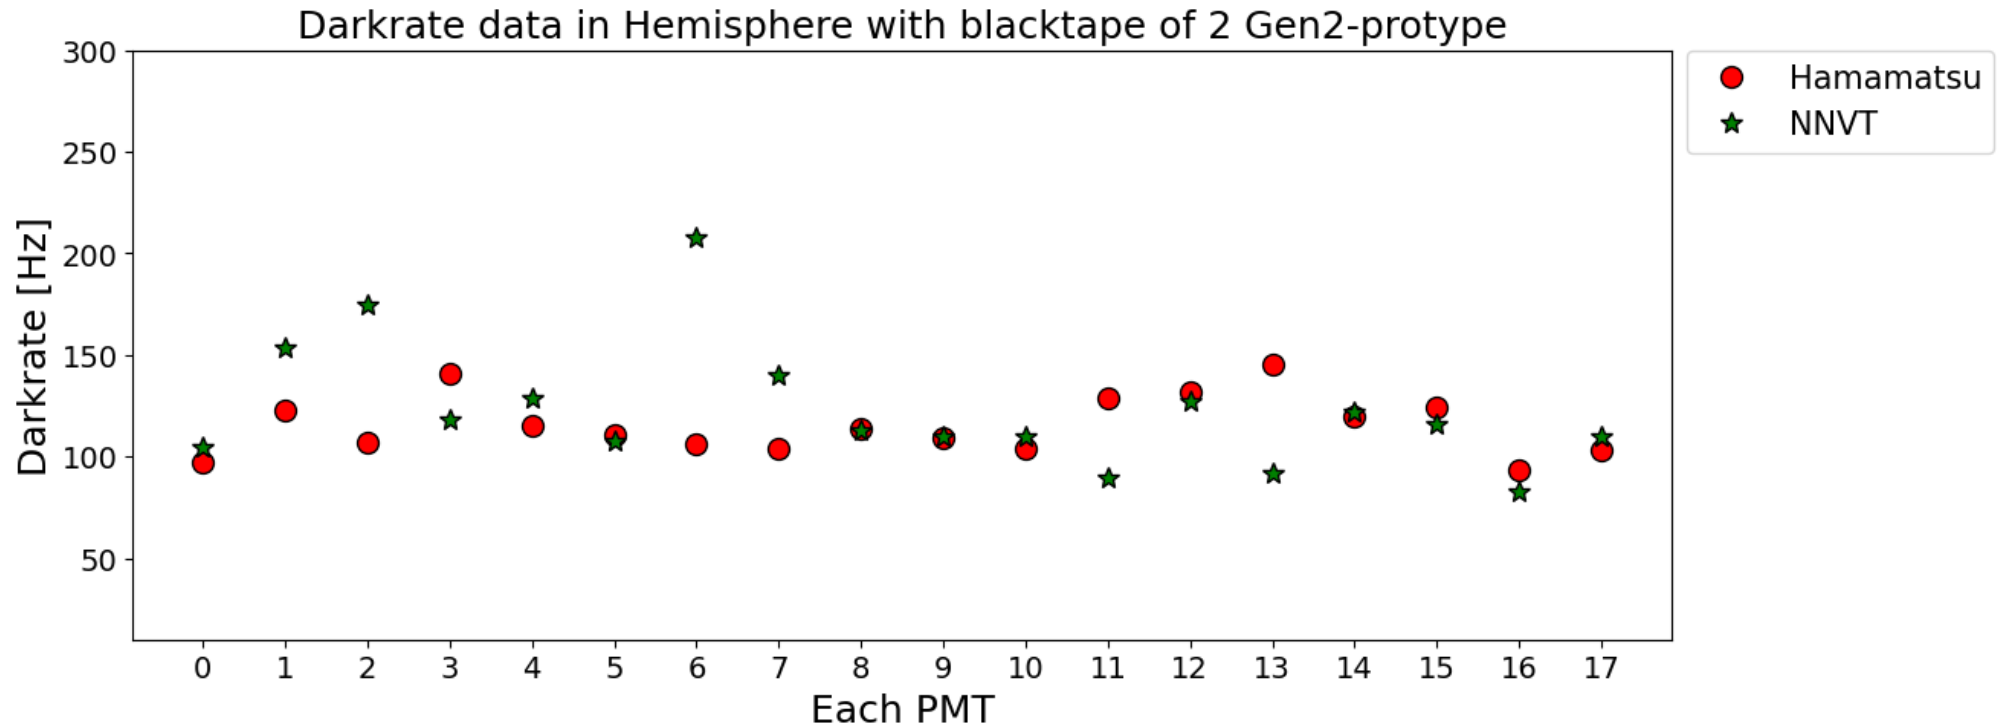

10 Gen2-prototypes are completed!

10

Progress of the gel pad production

Darkrate measurement of Gen2-prototype modules

| About | Japanese manufacturer(Hamamatsu) | Chinese manufacturer(NNVT) |
|----------------------------|----------------------------------|----------------------------|
| Average of 1PMT's Darkrate | 115 Hz | 122 Hz |

**Dark rate : About 120 Hz/PMT
For both vendors**

Comparison of the darkrates

12

DOM

Gen2-prototype

10 inch PMT \times 1

4 inch
PMT \times 18

The effective
darkrates
per module
improve
by **60%!!**

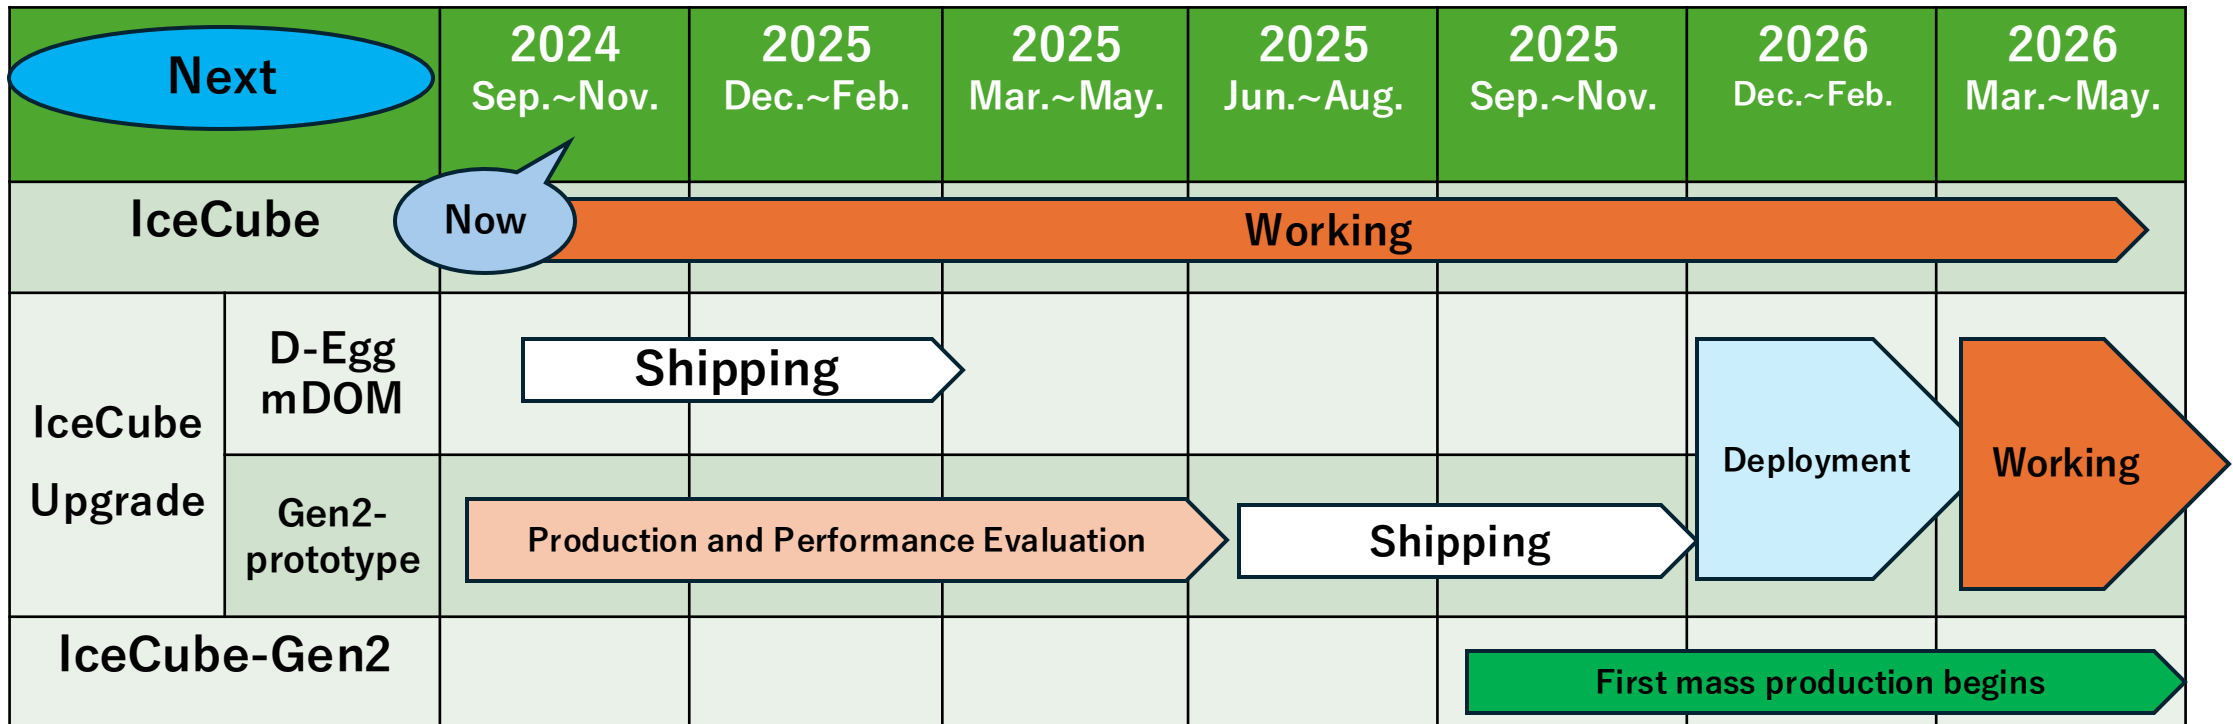

| | DOM | Gen2-prototype |
|--|------------------|-------------------|
| Darkrate/detector | ~ 1500 Hz | 2241 Hz |
| Effective area (400nm) | ~ 35 cm^2 | ~ 135 cm^2 |
| Arbitrary darkrate / effective area | 1 | ~ 0.4 |

Contribute to the physics
analysis of low-energy
neutrino events like
supernova

Summary and Next

Summary

- Chiba University has developed the Gen2-prototype, one of the candidate detectors for IceCube-Gen2
- We have been able to guarantee the performance for the Gen2 project

Back up

IceCube

Observation of high-energy neutrinos flying from space in the ice just below the South Pole

- 5160 “**DOM**” photodetectors buried within 1 km^3 of the ice
- Observation of Cherenkov light from the reaction between neutrinos and nucleons in ice

IceCube Future Extension

16

2011

2025~

Now

DOM

- Neutrino Observation Experiment in Antarctica.
- Detection area is 1 km^3
- Using the 5160 DOMs.

D-Egg

- Deployment begins in 2025
 - 300 D-Eggs (main)
 - 400 mDOM (main)
 - 12 Gen2-prototype (For testing for Gen2)
- To observe low energy neutrino.
- D-Egg is already ready to be shipped.

mDOM

Gen2-prototype

- Upgrade to observe high energy neutrinos (1PeV)
- Detection area is 8 km^3
- 10000 new detector will be installed

Undecided

Why do we need a new detector?

17

Gen2's Purpose : To observe high energy neutrinos **above 1PeV**

Need : Detection volume needs to be larger.

- Double-Bang events
- Charged-current interaction

Considerations

- Calibration by flasher
- Directional resolution
- Volume

Gen2 : Detector spacing set at **240m** (IceCube : 125m)

- Improve **neutrino detection frequency**
- Improve **Directional resolution**

➡ More sensitive detectors are now needed

Prototyping Stages and Conclusions

Brief descriptions of proof-of-concept and further prototype stages - Update as design evolves - Link to wikis or files in "shared documents" - add duplicate slides as necessary

- Temperature dependence of gel properties
 - No noticeable change down to -50°C

Production of Gen2-prototype

Adjust glass center

Fix PMT to frame

PMT inserted and attached to glass

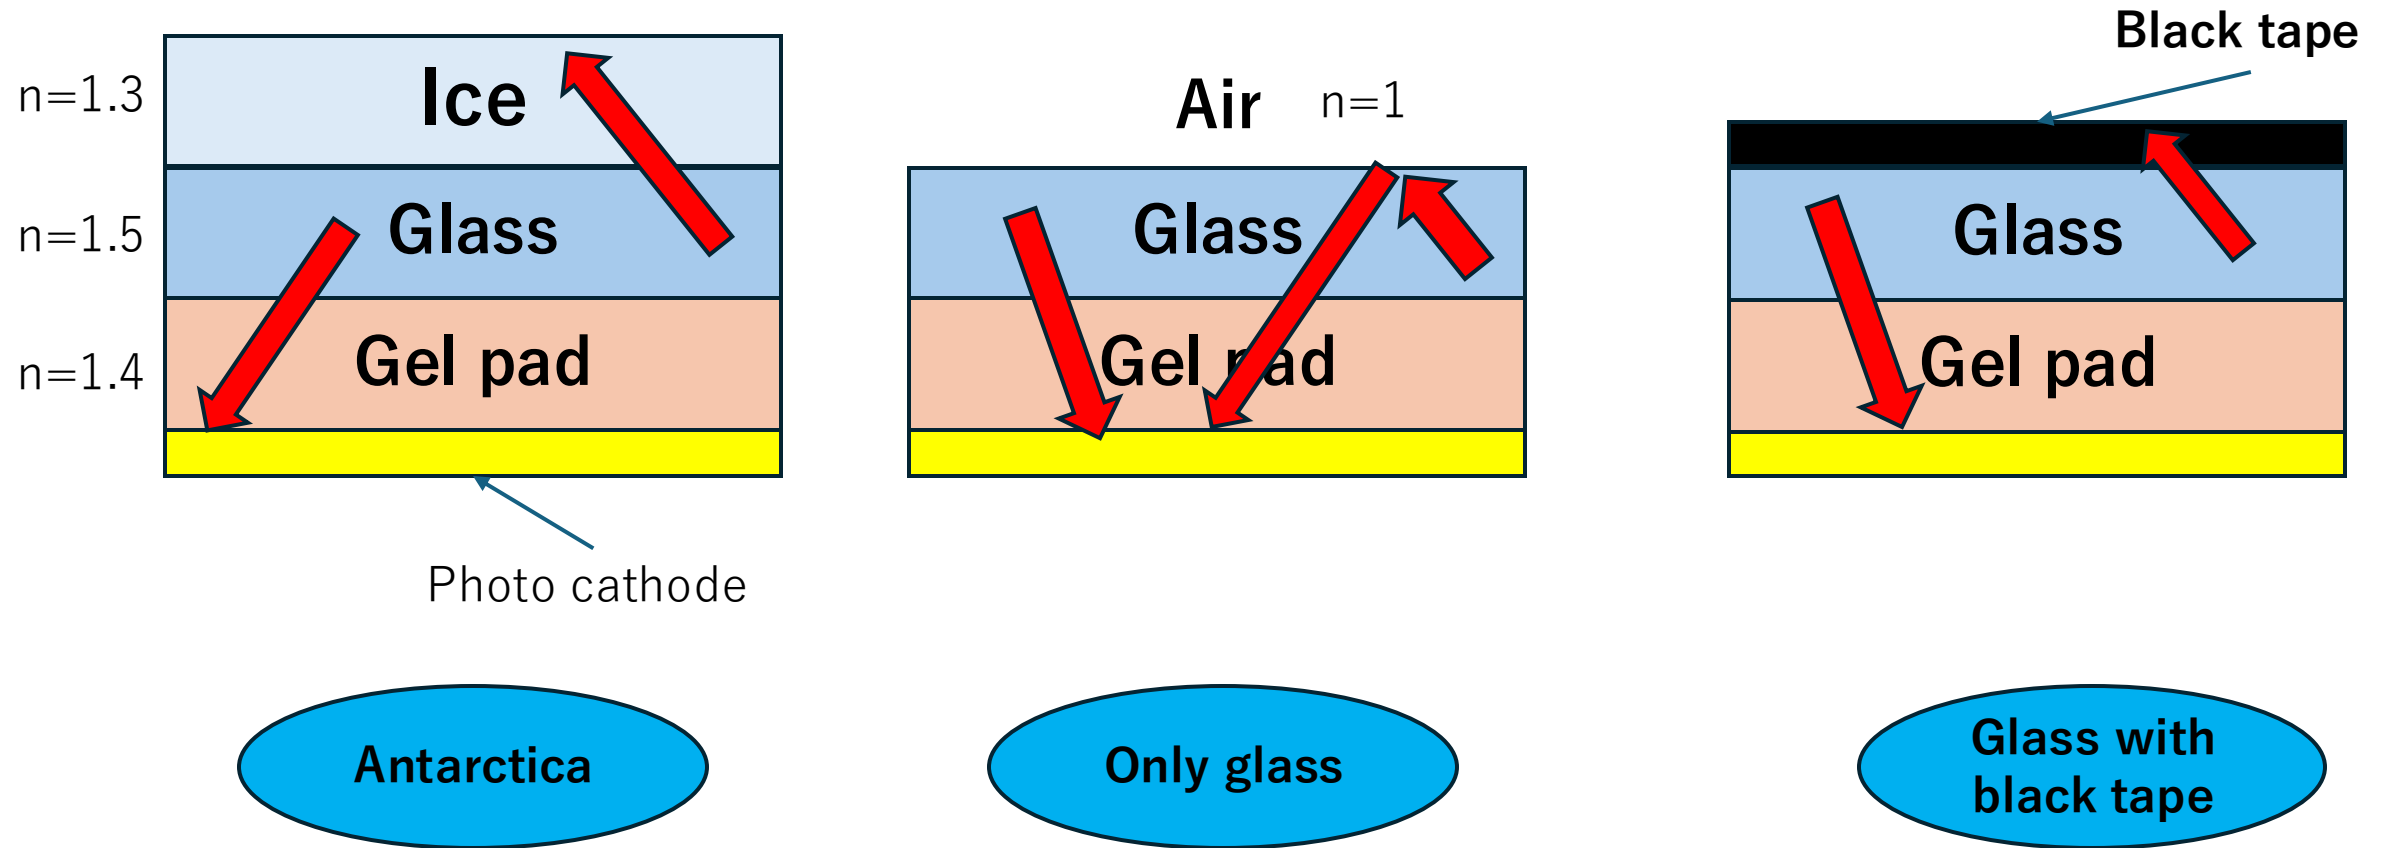

PMT and Gen2-prototype

20

Why wrap black tape around glass?

21

Comparison of Effective area

22

R. Abbasi et al, 2023

Comparison of darkrate with D-Egg

| About | D-Egg | Gen2-prototype |
|---------------------------|----------------------------|----------------------------|
| Effective area (400nm) | About 90 cm^2 | About 135 cm^2 |
| Darkrate/detector | About 2000Hz | 2241 Hz |
| Darkrate / Effective area | About 22 $\frac{Hz}{cm^2}$ | About 17 $\frac{Hz}{cm^2}$ |

where the IceCube detected the supernova signal

Supernova (~GeV) produces a weak and short-lived optical signal

Analysis of Supernovas near GeV need number of detector and low background of detector and so on

Gen2-prototype can contribute to its analysis!

➤ Topics of the test

- ① Gain
Measure the proper voltage for each PMT
- ② Dark rate
Signal frequency when light is blocked
- ③ Linearity
Response to intense light

| About | Hamamatsu | NNVT | Remarks |
|-----------------|-----------|------|--|
| Measured Number | 85 | 40 | |
| Gain issue | 0 | 2 | Charge Distribution couldn't be fitted |
| Dark rate issue | 0 | 2 | 5000Hz over |
| Linearity issue | 0 | 0 | |
